Highways and construction

A Construction Traffic Management Plan has been prepared. This document sets out the access proposals and considers any impacts during the construction period. The construction phase would last approximately 12 months after which the solar farm will operate for 40 years. Following the operational phase, the site will be decommissioned, and the land returned to its original use.

Access to the site will be shared with the existing solar farm to the west. All vehicles will approach the site from the A473, via Waterton Industrial Estate routing east before approaching the site from the north, avoiding routing through Treoes village. The vehicular route is shown in blue below. It is proposed that no construction vehicles will approach the site through the village of Treoes.

A compound and vehicle parking area will be provided on site during construction to ensure all vehicles can safely turn and leave the site in a forward gear. No parking of vehicles will be permitted on any nearby roads during construction.

Vehicle movements following construction will be limited to ongoing maintenance and monitoring and share the access point with the existing solar farm to the west.
